

One human. A coordinated agent organization.

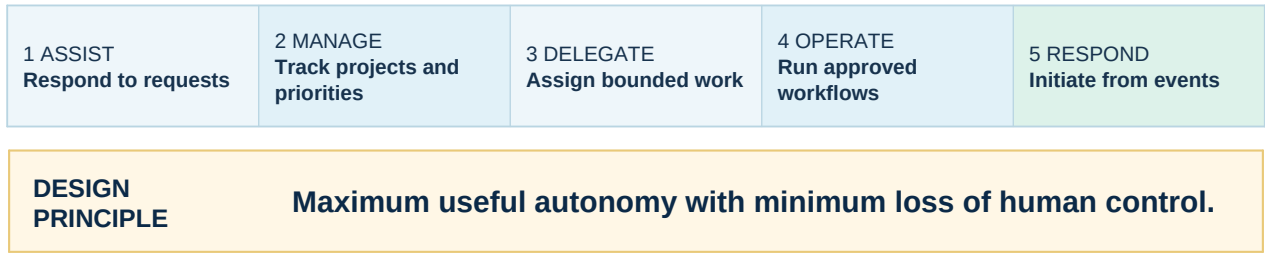

What began with NOWEDGE has revealed a larger opportunity: build a human-directed operating platform that can coordinate research, software, communication, and execution across many projects—without surrendering consequential decisions.

THE OPERATING MODEL

A disciplined path to leverage

Human authority · provenance · institutional memory · specialization · challenge mechanisms · bounded permissions · escalation · observability

Evidence becomes durable knowledge—and then action.

The research organization is no longer only a concept. Calvin already contains a reusable, bounded research kernel. The next step is to specialize it for market research and connect its reviewed conclusions to NOWEDGE through Maestro and Korero.

NASCENT ARCHITECTURE — WORKING TODAY

CAMPAIGN Objective, scope, budgets	SOURCES Reviewed providers	RUN Frozen configuration	EVIDENCE Fetched facts + provenance	FINDINGS Normalized, scored results	SNAPSHOT Immutable published brief
Bounded and recoverable Oban executes limited checkpoints. Budgets constrain pages, bytes, depth, delay, and wall time. Progress is persisted before handoff; interrupted runs can recover.			Auditable by construction Evidence retains canonical URL, digest, fetch status, extraction metadata, and time. Immutable snapshots preserve the last usable result during refresh.		

TRADING RESEARCH LAYER — NEXT

Specialist interpretation Technical, fundamental/catalyst, order-flow, historical, and educational researchers interpret the shared evidence graph.	Challenge and experiment A skeptic/red team and risk role test claims. Hypotheses become bounded experiments with explicit results—not persuasive narratives.	Promotion into NOWEDGE Validated setups and rules are reviewed, versioned, monitored, and surfaced at the moment of decision. Failures remain part of institutional memory.
---	---	---

OBSERVE → EVIDENCE → HYPOTHESIS → EXPERIMENT → RESULT → RULE → NOWEDGE

WHY ELIXIR · BEAM · PHOENIX LIVEVIEW

Architecture mirrors the organization	Lightweight isolated processes, message passing, supervision, and PubSub naturally model agents, conversations, jobs, applications, and events operating concurrently.
Real-time UI with one source of truth	LiveView turns server-owned state into incremental interface updates without a separate SPA state and API layer—reducing both technical and human coordination cost.
Credible operational lineage	Erlang/OTP brings decades of always-on systems experience. Discord uses Elixir extensively for real-time event fanout at massive scale; OpenAI's Symphony Elixir implementation uses Phoenix LiveView for agent observability.

Sources: Calvin research-crawler architecture (current implementation); Phoenix LiveView project; Discord Engineering, “How Discord Scaled Elixir to 5,000,000 Concurrent Users” and “Maxjourney”; OpenAI Symphony Elixir README. Product maturity claims are intentionally separated into working today vs. next.
